

Alejandro and David
students

"We have always been amazed by the space and Nanostar is a project which will enable to get closer to the space world. It is a chance that we can't miss.

Thanks to Nanostar, we have the opportunity to lead an engineering project at the same level which we will deal with in our future.

Furthermore, we can participate in a work environment which is unique, composed by students and teachers from different departments, from different universities.

This is a way to Exchange experiences, methodologies, knowledge and without Nanostar, we could not have Access to that. We are currently developing ideas and projects but we hope to contribute to the Nanostar project as it contributes to our careers. Without any doubt, this initiative will give us all we need for our profesional future."

Nanostar is a 2014-2020 Interreg Sudoe project which allows university students to be part of a whole real space engineer project which includes conception, design, implementation and documentation.
